In mild or moderate cases, treatment for haemophilia may only be necessary as an immediate response to bleeding. Haemophilia A. People with haemophilia A can be treated on-demand with injections of octocog alfa or a medication called desmopressin. Desmopressin is a synthetic hormone.

Haemophilia - Treatment - NHS

Haemophilia figured prominently in the history of European royalty in the 19th and 20th centuries. Britain's Queen Victoria, through two of her five daughters, Princess Alice and Princess Beatrice, passed the mutation to various royal houses across the continent, including the royal families of Spain, Germany and Russia. Victoria's son Prince Leopold, Duke of Albany, also suffered from the disease.

Haemophilia in European royalty - Wikipedia

Hemophilia is a bleeding disorder that slows the blood clotting process. People with this condition experience prolonged bleeding or oozing following an injury, surgery, or having a tooth pulled. In severe cases of hemophilia, continuous bleeding occurs after minor trauma or even in the absence of injury (spontaneous bleeding). Serious complications can result from bleeding into the joints ...

Hemophilia - Genetics Home Reference - NIH

Haemophilia is a rare condition that affects the blood's ability to clot. It's usually inherited, and most people who have it are male. Normally, when you cut yourself, substances in the blood known as clotting factors combine with blood cells called platelets to make the blood sticky.
