Total Knee Replacement

Total knee replacement surgery is considered for patients whose knee joints have been damaged by either progressive arthritis, trauma, or other rare destructive diseases of the joint. The most common reason for knee replacement in the United States is severe osteoarthritis of the knees. Regardless of the cause of the damage to the joint, the resulting progressively increasing pain and ...

Total Knee Replacement Recovery & Surgery Risks

What is a Total Knee Replacement (TKR)? A total knee replacement (TKR), also known as total knee arthroplasty, involves removing the arthritic parts of the bones at the knee joint (the tibia, sometimes called the shin bone; the femur, or thigh bone; and the patella, or kneecap) and replacing them with artificial parts.
