Physical signaling sublayer. In a local area network (LAN) or a metropolitan area network (MAN) using Open Systems Interconnection (OSI) architecture, the physical signaling sublayer is the portion of the physical layer that interfaces with the data link layer's medium access control (MAC) sublayer.; performs character encoding, transmission, reception and decoding and,

Media Access Control (MAC address or Layer 2 addresses or physical address or hardware address) addresses are 48 bit (six bytes) binary addresses represented in hexadecimals. The purpose of representing the binary address in hexadecimal format is to make it easier for humans to read and understand. MAC addresses are theoretically permanent numbers, which are burned into the network card.

In Seven Layers of Open Systems Interconnection (OSI) Model lesson, you will learn about the seven layers of OSI model and their functions. If network communications need to happen with out any trouble, many problems must be solved. Coordinating all these problems are so complex and not easy to manage.

When obtaining data from the Physical layer, the Data Link layer checks for physical transmission errors and packages bits into data "frames". The Data Link layer also manages physical addressing schemes such as MAC addresses for Ethernet networks, controlling access of any various network devices to the physical medium. Because the Data Link layer is the single most complex layer in the OSI ...
